## Hints for Successful Treatment of Bulbs

There are few plants that will give the lover of flowers more satisfaction as bulbous plants, with their gloriously colored and sweet scented flowers.

What could more brighten up the house during the dull winter months than a pot of self-grown bulbous flowers? What brings more cheer to the sick than the bright colors of Tulips, and what is more fitting a Christmas gift?

For **Indoor Culture,** bulbs may be planted as long as they are good and solid, and the earlier the better. White Roman Hyacinths, Freesias, Paper White Narcissus will never fail to be in bloom by Christmas. Plant all bulbs in a nice sandy soil in pots, pans or boxes, and after planting place them outside or in the cellar, water them thoroughly and cover the pots, etc., with at least 3 inches of more soil, and when outside a liberal layer of leaves should be applied to prevent them from freezing. Keep on watering now and then and when the shoots have grown 2 to 3 inches bring them to the light and they will soon bloom. If bulbs are brought to the light earlier, the flowers will be short and crippled.

For **Outdoor Culture,** it is only necessary to plant as early as possible and select a place where no water will stand during the winter. Plant all bulbs about 3 times as deep as the bulbs are thick. A covering of leaves or manure is good during the winter; it keeps a more even temperature, but this covering should not be applied till the ground is frozen a few inches deep, as otherwise bulbs would start into growth too soon and an early frost would kill them before blooming.
